

# “AQUABOX COMMUNITY”

The **Aquabox Community** encompasses an **AquaFilter Community** that is based on the use of the same well-proven micropore technology of the AquaFilter Family. It is shipped in the same robust ridged plastic container as those used for the Standard Aquaboxes. Each box has a capacity of roughly 75 litres and this forms the basis of the AquaFilter Community unit.

Every **AquaFilter Community** is capable of generating up to 500,000 litres of drinking water from the local contaminated water sources. This is enough basic drinking water for 100 families of 6 (600 people) for well over a year and half; over 500 tonnes of drinking water.

- Aquabox Community contains only the filtration unit and does not contain the ancillary survival bags or the humanitarian aid items of the Standard Aquabox.
- Aquabox Community's are not sent out for filling, but are available for sponsorship via donations.  
(See **Order Form**)
- Aquabox Communities are produced and despatched to areas of dire need and where their distribution can be well monitored by the distributing aid agencies.

- Aquabox Communities are often sent out to supplement each full container load shipment of Standard Aquaboxes.
- Aquabox Communities are also particularly useful in meeting the drinking water needs of the hospitals and schools in the disaster-struck areas.

## Aquabox Community Contents;

- One AquaFilter Community
- Drainage tap
- Set of Instructions
